

Distributed Consensus Engine: Technical Specification v2.4

1. Architecture Overview

The consensus module maintains an invariant Byzantine fault tolerant log across distributed validator nodes.

2. Primitive Interface Definition

```
def commit_block(state: NodeState, tx_root: bytes) -> bool:
```

```
    return state.apply_payload(tx_root, verify_sig=True)
```

- High-throughput pipelined verification.
- Zero-knowledge state transition oracles.
